Hello

This is your shiny new 1080p dashboard.

Protip: You can drag the widgets around!

Widget

text.coffee

text.scss

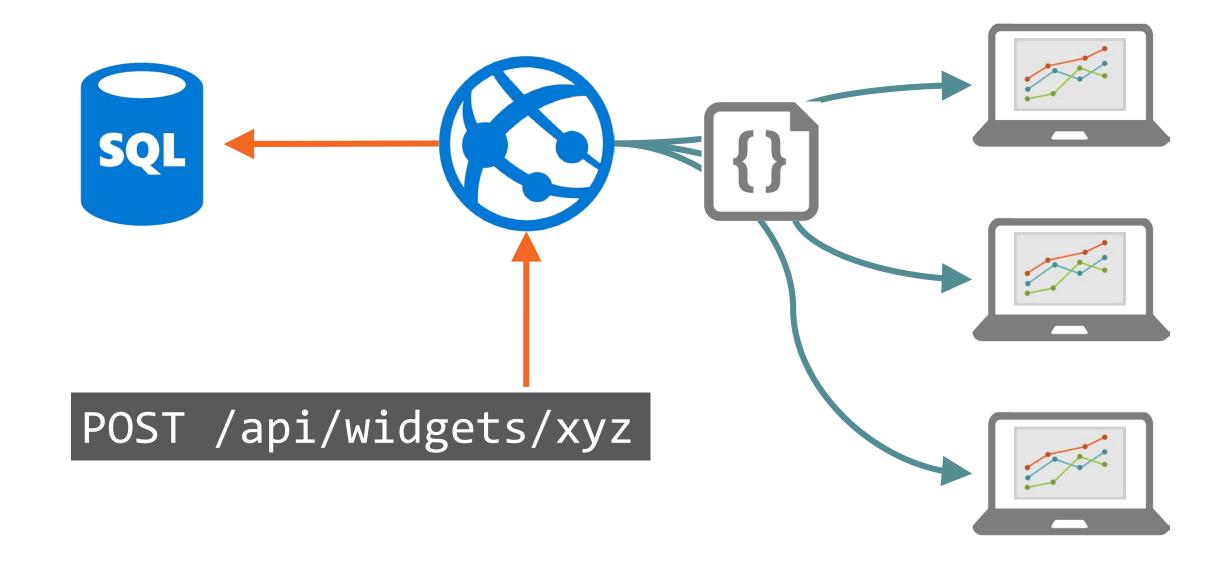

text.html

View

```
<div data-id="t1" data-view="Text">
```

Data

{ "text" : "Welcome to dashing" }

Demo: the Number widget

Adding the Number widget

Posting updates with REST

Formatting the output

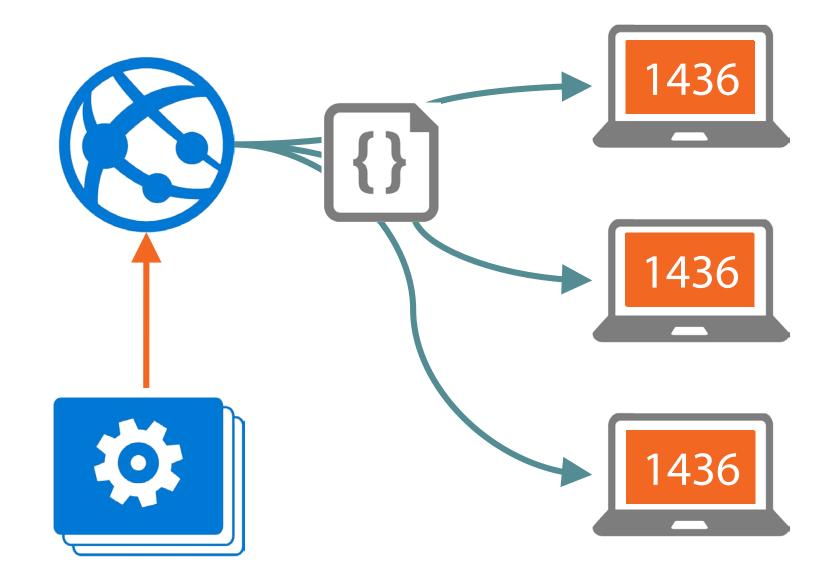

Widgets in the View

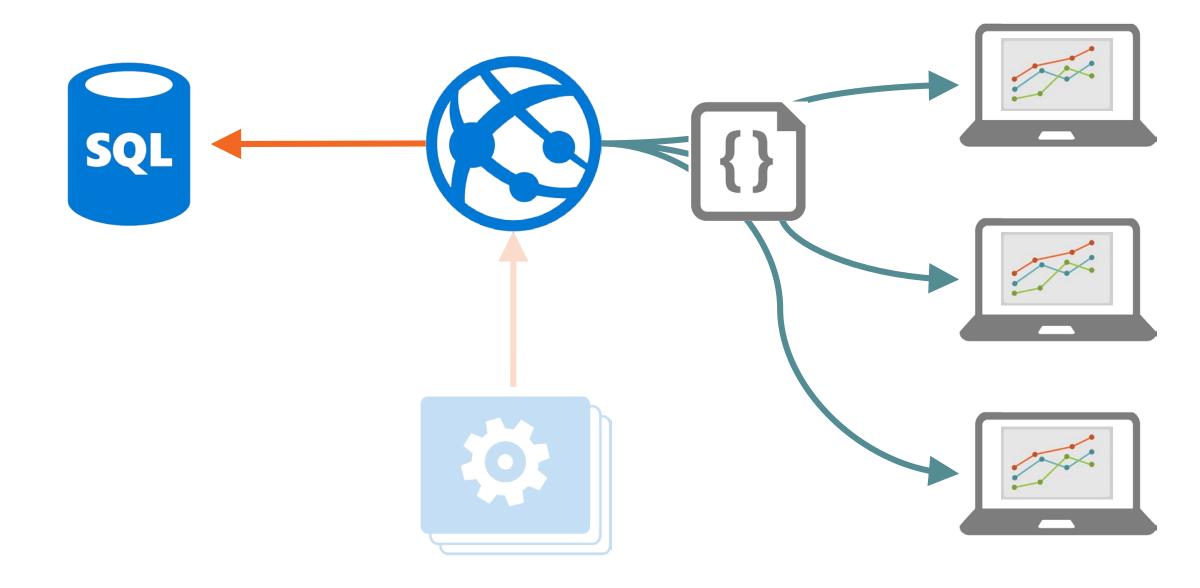

Gridster list item, widget div

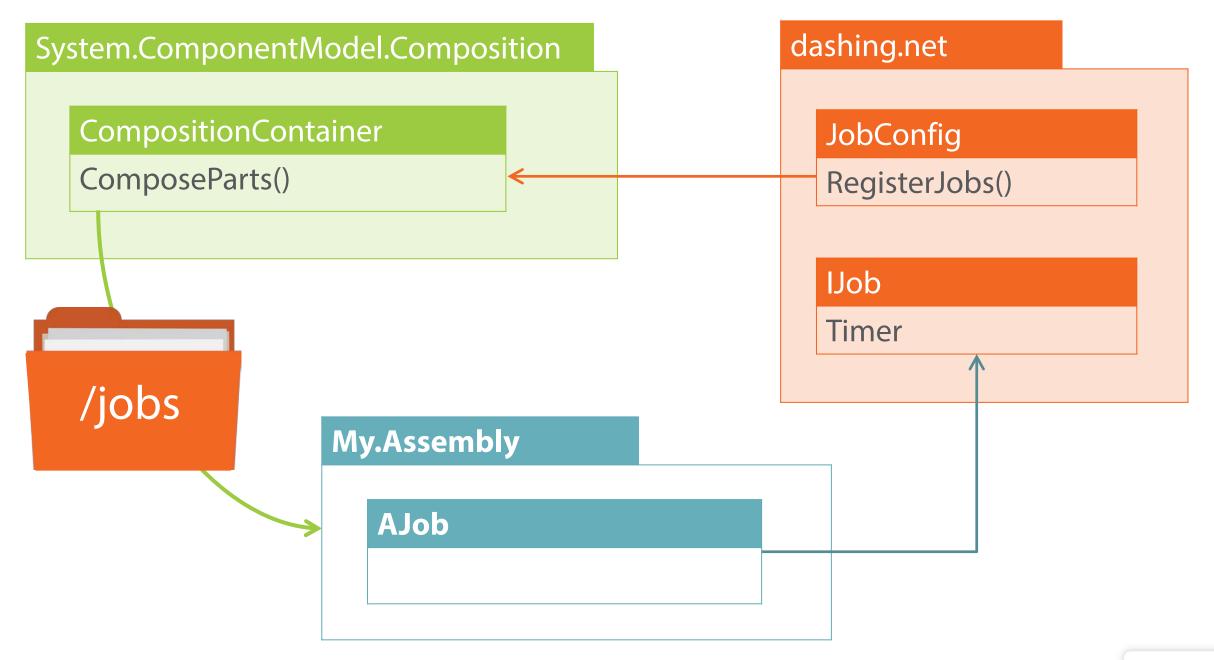

```
POST
http://localhost:49169/widgets/events-totalcount
{ 'auth_token': 'pl*ral5!ght', 'current': 310790413 }
```

Updating widgets with REST

POST JSON to the dashing.net API

Interval @ 30 seconds
Query SQL
Send message

Demo: EventsBreakdownJob

Implements IJob

Timer queries SQL

Pushes updated data to widget

```
public interface IJob
{
    Lazy<Timer> Timer { get; }
}
```

IJob

Lazy Timer initialized by Dashing

```
[Export(typeof(IJob))]
public class EventsBreakdownJob : IJob
{
   Lazy<Timer> Timer { get; private set; }
```

IJob implementation

Flag with Export to expose to MEF

```
public EventsBreakdown()
{
    Timer = new Lazy<Timer>(() => new Timer(
        SendDeviceEvents, null,
        TimeSpan.Zero, TimeSpan.FromSeconds(30)));
}
```

Events breakdown job

Counts all events when timer fires

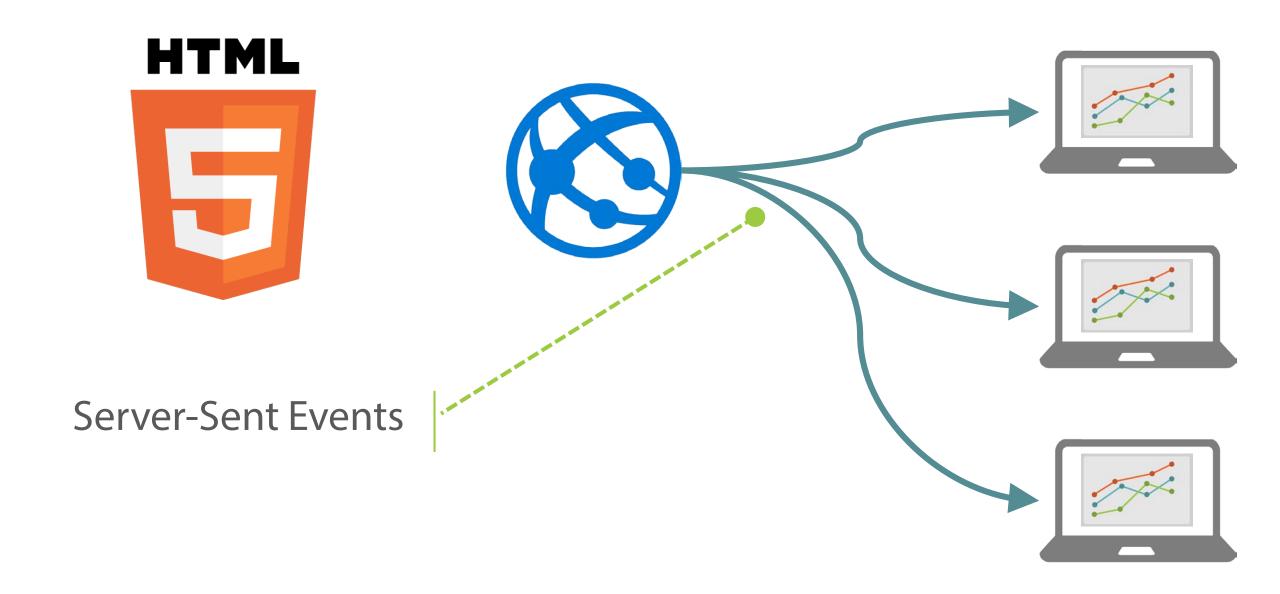

Timer callback

Fetch current data

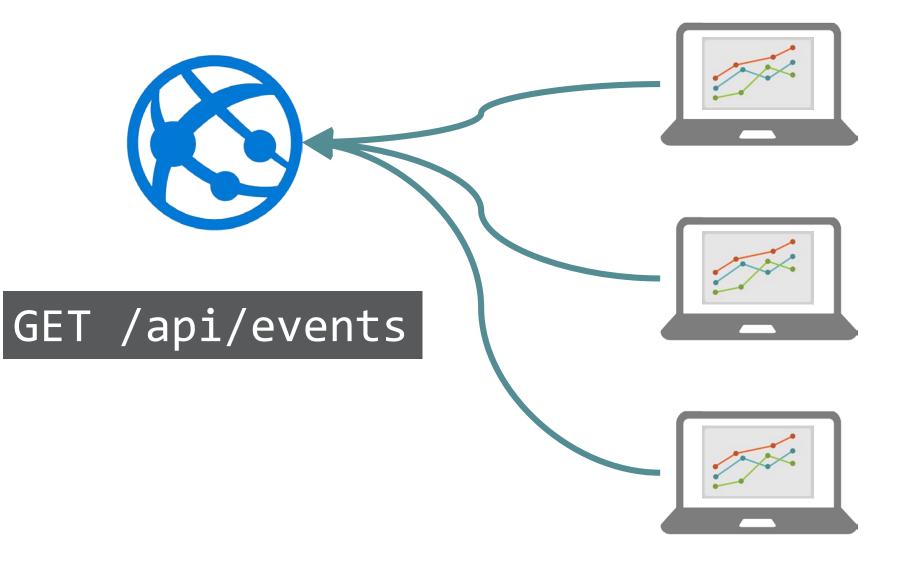

```
var message = new
{
   id = "events-totalcount",
      current = eventCount
};
Dashing.SendMessage(message);
```

Update widget

Send new data message

HTML

```
HttpResponseMessage response = request.CreateResponse();
response.Content =
   new PushStreamContent(WriteToStream, "text/event-stream");
```

Dashing EventsController

Return PushStreamContent for Server-Sent Events

```
if (_streamWriter.TryDequeue(out streamWriter))
{
    try
    {
        streamWriter.WriteLine(message);
        streamWriter.Flush();
```

Sending events

Write to client streams

```
source = new EventSource('/api/events')
source.addEventListener 'open', (e) ->
    console.log("Connection opened")
```

Client side

Subscribe with event listener

```
source.addEventListener 'message', (e) =>
data = JSON.parse(e.data)
//...
for widget in widgets[data.id]
widget.receiveData(data)
```

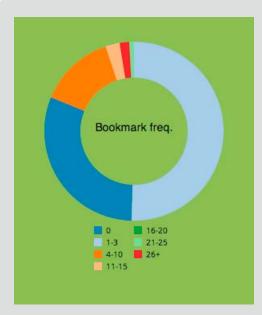

Receiving events

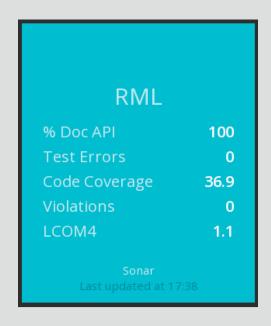

Parse JSON, update widgets by ID

Demo: the Pie widget

Adding the widget

Updating Pie data

Using the List widget

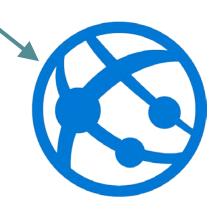

Widget

pie.coffee

pie.scss

pie.html

```
<div data-id="events-top"
    data-view="Pie"
    data-title="Top Events"
    style="background-color:#69DE3D;">
</div>
```

The Pie widget

Configure ID, title and styling

```
var pieData = events.Select(x => new
{
    label = x.Key.Substring(x.Key.IndexOf(".")+1),
    value = x.Value
});
```

Pie widget data

Array of objects with label & value

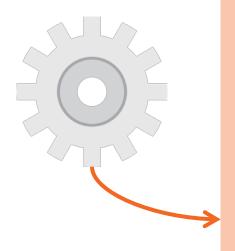

```
var pieMessage = new
{
   value = pieData,
   id = "events-top"
};
Dashing.SendMessage(pieMessage);
```

Send Pie message

Object array and widget ID

Event breakdown data

Grouped by event name

Demo: publishing to Azure

Completed Events dashboard

Publish as Azure Web App

Secure with IP whitelist

Build WebDeploy package

Generate ZIP file for publishing

```
New-AzureWebsite -Name 'my-dashboard'
-Location 'North Europe'
Publish-AzureWebsiteProject -Name 'my-dashboard'
-Package 'Dashboard.zip'
```

Publish Azure Web App

PowerShell cmdlets & WebDeploy package

IP security

Whitelist allowed IP addresses

```
<rule>
    <match url="(.*)" />
    <conditions> <add ipAddress
        <add input="{HTTPS}" pattern="off" ignoreCase="true" />
        </conditions>
        <action type="Redirect" url="https://{HTTP_HOST}/{R:1}" />
```

Force SSL

URL rewrite directing HTTP to HTTPS

OWASP Top 10 Web Application Security Risks for ASP.NET
